

# Materials Research for Zero Emission Buildings

**Bjørn Petter Jelle** <sup>ab</sup>

<sup>a</sup> Department of Materials and Structures,  
SINTEF Building and Infrastructure, NO-7465 Trondheim, Norway.

<sup>b</sup> Department of Civil and Transport Engineering,  
Norwegian University of Science and Technology (NTNU), NO-7491 Trondheim, Norway.

**Klimax Breakfast Seminar, Trondheim, Norway, 20th of November, 2014.**

# Examples of Materials Research Related to the Building Envelope

With selected commercial examples

## Thermal Insulation

- Traditional
- State-of-the-art
- Future

## Phase Change Materials

## Coating and Window Materials and Technologies

- Low Emissivity Coatings
- Electrochromic Materials
- Aerogel Glazing
- New Glass Materials

## Building Integrated Photovoltaics (BIPV)

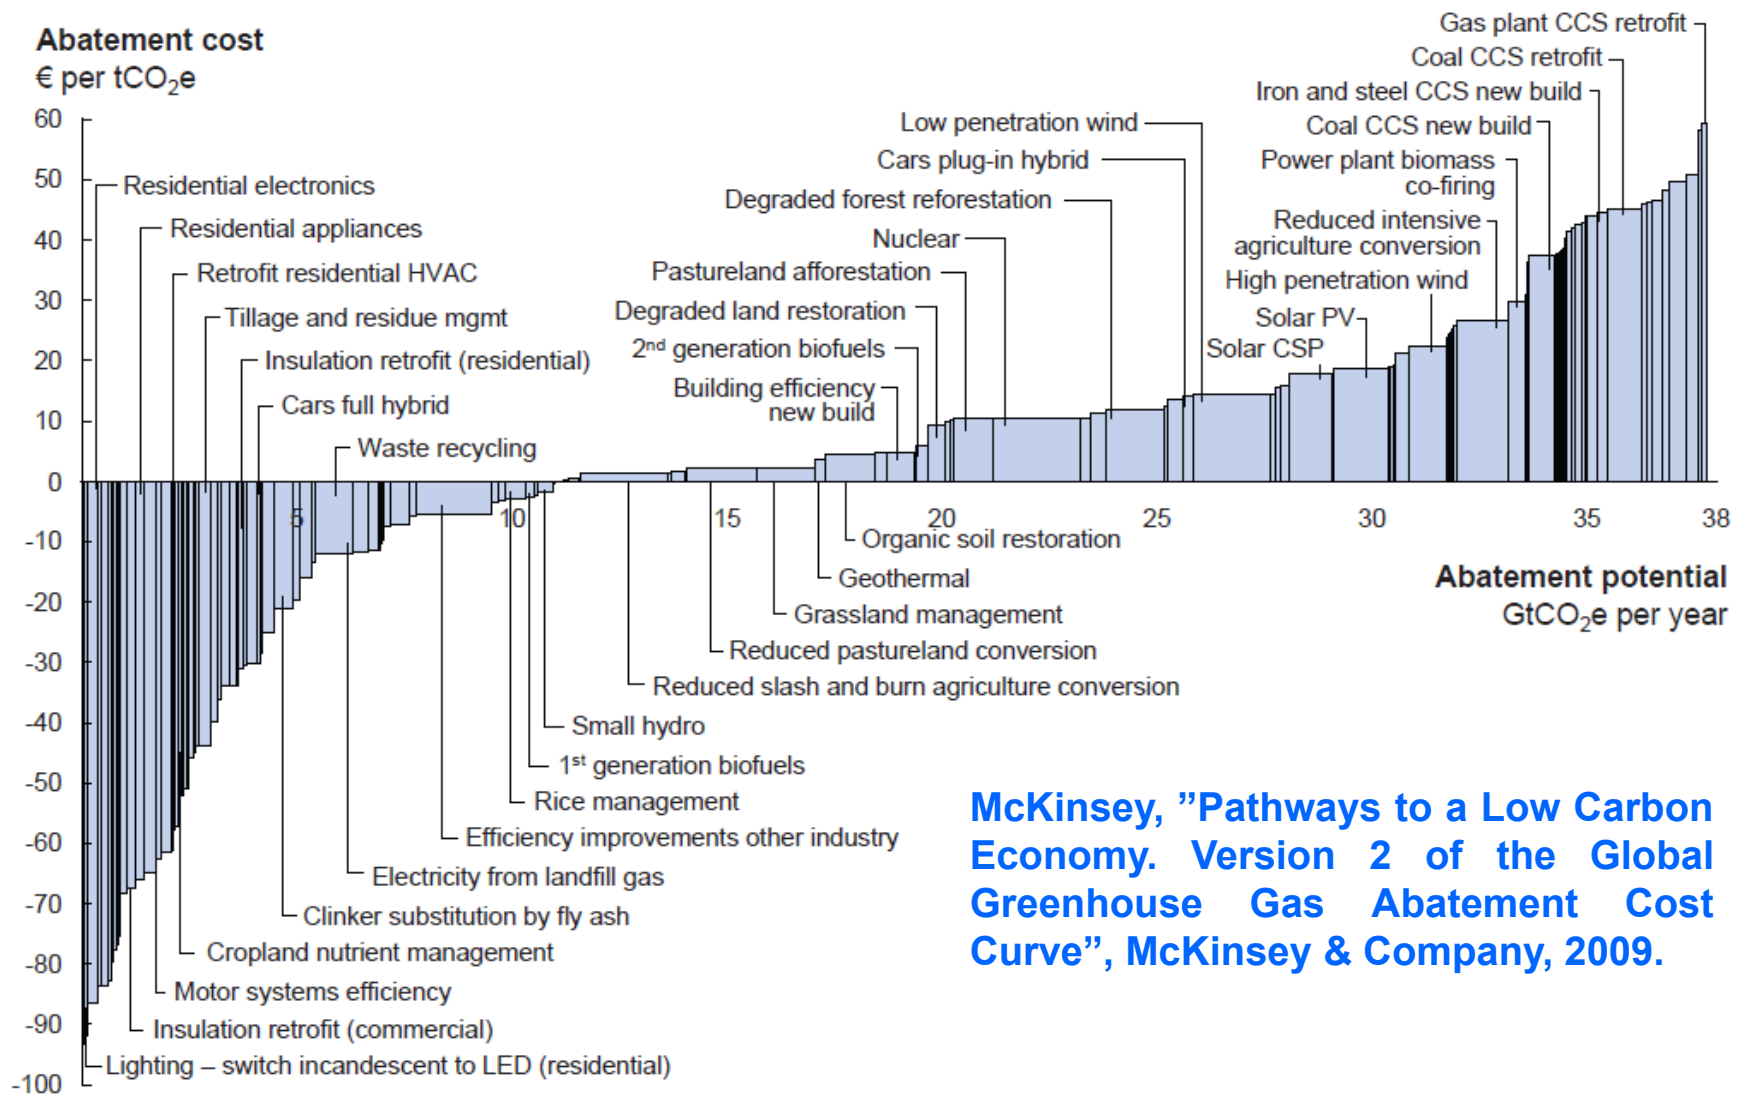

- Solar Cell Material Properties and Requirements
- Building Envelope Properties and Requirements

# Why is Thermal Insulation Important ?

## - What Measures Amounts the Most ?

Global GHG abatement cost curve beyond business-as-usual – 2030

McKinsey, "Pathways to a Low Carbon Economy. Version 2 of the Global Greenhouse Gas Abatement Cost Curve", McKinsey & Company, 2009.

Note: The curve presents an estimate of the maximum potential of all technical GHG abatement measures below €60 per tCO<sub>2</sub>e if each lever was pursued aggressively. It is not a forecast of what role different abatement measures and technologies will play.  
Source: Global GHG Abatement Cost Curve v2.0

# Thermal Background – Thermal Transport

## - Thermal Conductivity Contributions

$$\lambda_{\text{tot}} = \lambda_{\text{solid}} + \lambda_{\text{gas}} + \lambda_{\text{rad}} + \lambda_{\text{conv}} + \lambda_{\text{coupling}} + \lambda_{\text{leak}}$$

$\lambda_{\text{tot}}$  = total overall thermal conductivity

$\lambda_{\text{solid}}$  = solid state thermal conductivity

$\lambda_{\text{gas}}$  = gas thermal conductivity

$\lambda_{\text{rad}}$  = radiation thermal conductivity

$\lambda_{\text{conv}}$  = convection thermal conductivity

$\lambda_{\text{coupling}}$  = thermal conductivity term accounting for second order effects between the various thermal conductivities

$\lambda_{\text{leak}}$  = leakage thermal conductivity

**in mW/(mK)**

# Traditional Thermal Insulation of Today

- What is Out There?

- **Mineral Wool**
  - Glass wool (fibre glass)
  - Rock wool
  - 30-40 mW/(mK)
- **Expanded Polystyrene (EPS)**
  - 30-40 mW/(mK)
- **Extruded Polystyrene (XPS)**
  - 30-40 mW/(mK)
- **Cellulose**
  - 40-50 mW/(mK)
- **Cork**
  - 40-50 mW/(mK)
- **Polyurethane (PUR)**
  - Toxic gases (e.g. HCN) released during fire
  - 20-30 mW/(mK)

*Will often require very thick building envelopes*

# State-of-the-Art Thermal Insulation of Today

## - What is Out There?

### ■ Vacuum Insulation Panels (VIP)

*"An evacuated foil-encapsulated open porous material as a high performance thermal insulating material"*

- Core (silica, open porous, vacuum)
- Foil (envelope) - 4 - 8 - 20 mW/(mK)

### ■ Gas-Filled Panels (GFP) - 40 mW/(mK)

### ■ Aerogels - 12 - 20 mW/(mK)

### ■ Phase Change Materials (PCM)

- Solid State  $\leftrightarrow$  Liquid
- Heat Storage and Release

### ■ Beyond State-of-the-Art High Performance Thermal Insulation Materials ?

# Major Disadvantages of VIPs

- Thermal bridges at panel edges
- Expensive at the moment, but calculations show that VIPs may be cost-effective even today
- Ageing effects - Air and moisture penetration
  - 4 mW/(mK) fresh
  - 8 mW/(mK) 25 years
  - 20 mW/(mK) perforated
- Vulnerable towards penetration, e.g nails
  - 20 mW/(mK)
- Can not be cut or adapted at building site
- Possible improvements?

- Vacuum Core  
- Air and Moisture Tight Envelope

# Potential Cost Savings by Applying VIPs

Market Value Living Area (EUR/m<sup>2</sup> living area)

B. P. Jelle, "Traditional, State-of-the-Art and Future Thermal Building Insulation Materials and Solutions - Properties, Requirements and Possibilities", *Energy and Buildings*, 43, 2549-2563, 2011.

## Assumed example values

- Building of 10 m x 10 m
- Interior floor to ceiling height of 2.5 m
- 20 cm wall thickness reduction
- VIP costs 6 cm: 200 EUR/m<sup>2</sup>
- Mineral wool costs 35 cm: 20 EUR/m<sup>2</sup>

# Concrete – High Thermal Conductivity ⇒ Large Heat Loss

## ■ Thermal Conductivity

### ■ Concrete

- 150 – 2500 mW/(mK)

### ■ Traditional Thermal Insulation

- 36 mW/(mK)

### ■ Vacuum Insulation Panels (VIPs)

- 4 mW/(mK)

Possible to decrease the thermal conductivity of concrete?

# Large CO<sub>2</sub> Emissions from Cement Production

DEDICATED TO MAKING A DIFFERENCE

our agenda for action

July 2002

World Business Council for Sustainable Development

- The cement industry produces 5 % of the global man-made CO<sub>2</sub> emissions of which:
  - 50 % from the chemical process
    - e.g.:  $3\text{CaCO}_3 + \text{SiO}_2 \rightarrow \text{Ca}_3\text{SiO}_5 + 3\text{CO}_2$   
 $2\text{CaCO}_3 + \text{SiO}_2 \rightarrow \text{Ca}_2\text{SiO}_4 + 2\text{CO}_2$
  - 40 % from burning fossil fuels
    - e.g. coal and oil
  - 10 % split between electricity and transport uses

**And let us not forget the corrosion issues with reinforced concrete...**

# Nano Technology and Thermal Insulation

## Nano Particles

0.1 nm - 100 nm

## Nano Pores

0.1 nm - 100 nm

# Nano Insulation Material (NIM)

**NIM - A basically homogeneous material with a closed or open small nano pore structure with an overall thermal conductivity of less than 4 mW/(mK) in the pristine condition**

# The Knudsen Effect – Nano Pores

## Gas Thermal Conductivity $\lambda_{\text{gas}}$

$$\lambda_{\text{gas}} = \frac{\lambda_{\text{gas},0}}{1 + 2\beta\text{Kn}} = \frac{\lambda_{\text{gas},0}}{1 + \frac{\sqrt{2\beta k_B T}}{\pi d^2 p \delta}}$$

$\sigma_{\text{mean}} > \delta$   
 $\Rightarrow$  LOW  $\lambda_{\text{gas}}$

where

$$\text{Kn} = \frac{\sigma_{\text{mean}}}{\delta} = \frac{k_B T}{\sqrt{2\pi d^2 p \delta}}$$

- $\lambda_{\text{gas}}$  = gas thermal conductivity in the pores (W/(mK))
- $\lambda_{\text{gas},0}$  = gas thermal conductivity in the pores at STP (standard temperature and pressure) (W/(mK))
- $\beta$  = coefficient characterizing the molecule - wall collision energy transfer efficiency (between 1.5 - 2.0)
- $\text{Kn} = \sigma_{\text{mean}}/\delta = k_B T / (2^{1/2} \pi d^2 p \delta)$  = the Knudsen number
- $k_B$  = Boltzmann's constant  $\approx 1.38 \cdot 10^{-23}$  J/K
- $T$  = temperature (K)
- $d$  = gas molecule collision diameter (m)
- $p$  = gas pressure in pores (Pa)
- $\delta$  = characteristic pore diameter (m)
- $\sigma_{\text{mean}}$  = mean free path of gas molecules (m)

# Gas Thermal Conductivity

## Conductivity vs. Pore Diameter

# Hollow Silica Nanospheres (HSNS)

Hollow silica nanospheres by making and applying equal-sized templates

From Theory to Experiment

NIM

- Controlling:
- Sphere inner diameter
- Sphere wall thickness

# Hollow Silica Nanospheres

**From Theory to Experiment**

**Spherical PS templates**

**Small silica particles coated around a spherical PS template**

**HSNS after removal of PS**

## SEM Photos

**PS = Polystyrene**  
**HSNS = Hollow Silica Nanospheres**

# To Envision Beyond Concrete ?

- *In the community of concrete it might be compared to using profane language in the church and close to blasphemy to suggest that maybe the answer is not concrete after all... 👍😊*

## ■ Concrete:

- High thermal conductivity.
- Total thickness of the building envelope will often become unnecessary large (passive house, zero energy building or zero emission building).
- Large CO<sub>2</sub> emissions connected to the production of cement.
- Prone to cracking induced by corrosion of the reinforcement steel.
- Easy accessible and workable, low cost and local production.
- High fire resistance.

**Emphasis on Properties and Functional Requirements**

- Is it possible to envision a building and infrastructure industry without an extensive usage of concrete?

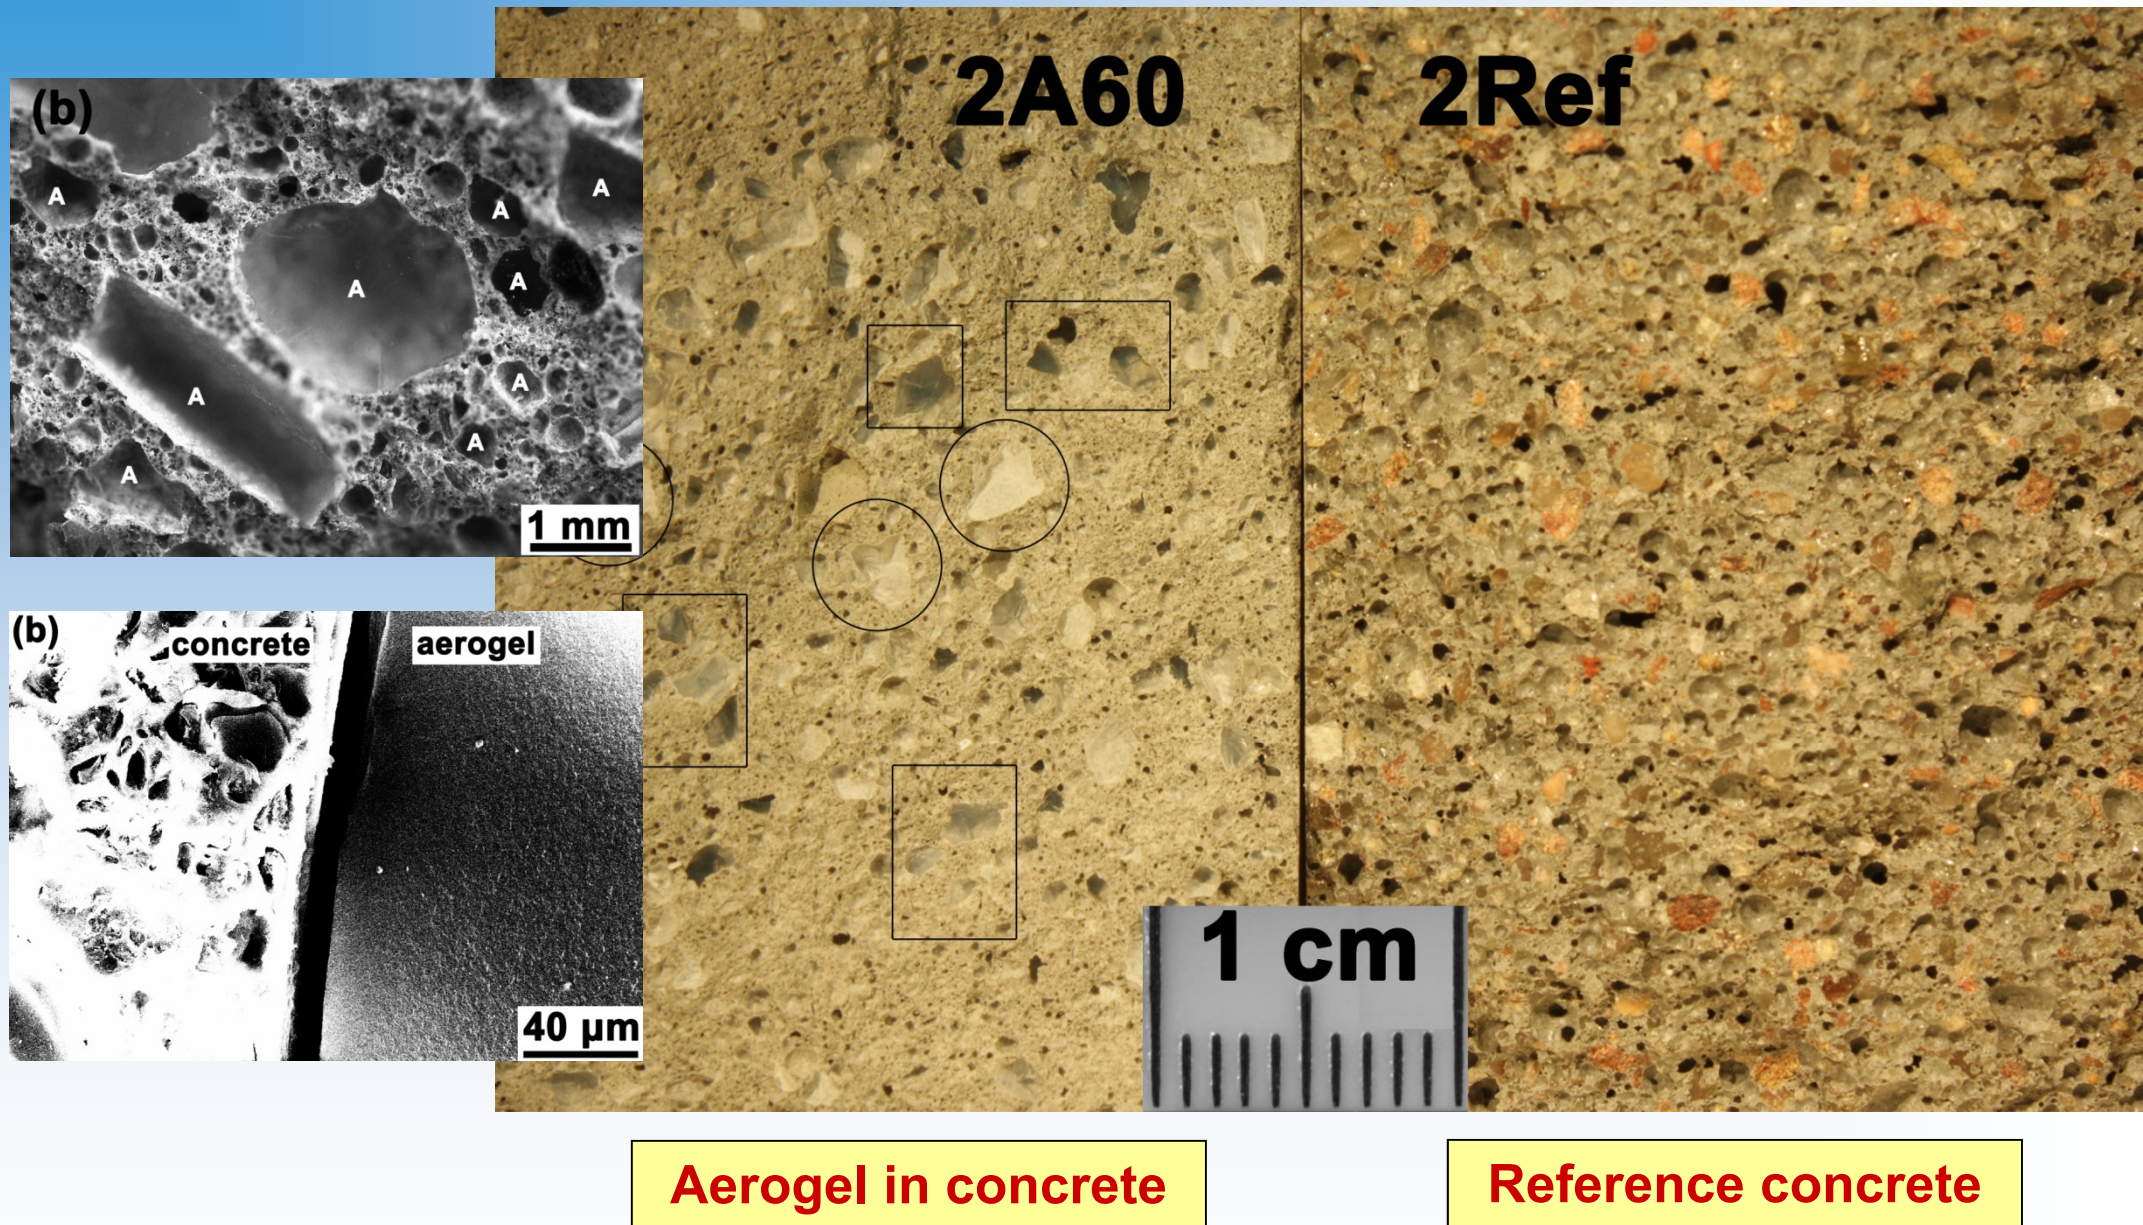

# NanoCon – Introducing a New Material

- NanoCon
- Basically a homogeneous material
- Closed or open small nano pore structure
- Overall thermal conductivity  $< 4 \text{ mW}/(\text{mK})$  (or another low value to be determined)
- Exhibits the crucial construction properties that are as good as or better than concrete.
  - Utilize carbon nanotubes (CNT)? Tensile strengths of 63 GPa (measured) and 300 GPa (theoretical). (Steel rebars 500 MPa and concrete 3 MPa.)
- Essentially, NanoCon is a NIM with construction properties matching or surpassing those of concrete.

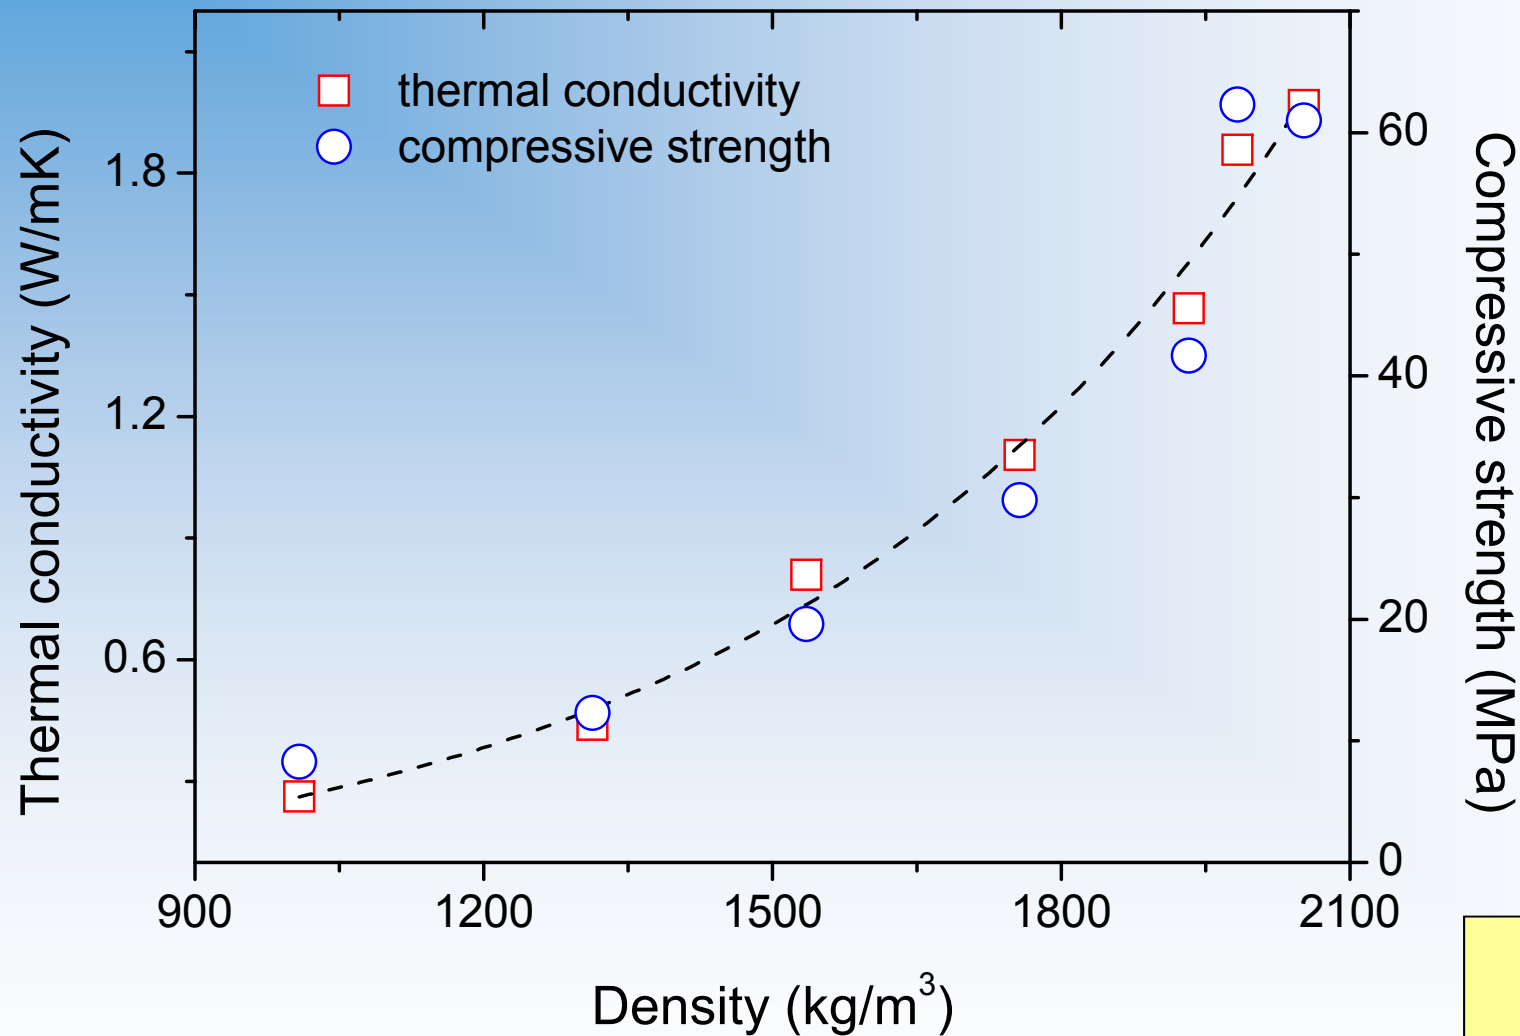

# The First Step - Aerogel Incorporated Concrete

# Aerogel Incorporated Concrete

Thermal conductivity and compressive strength vs. mass density for varying aerogel content

Dashed line =  
 $y = A \exp(Bx)$

# Concrete with NIM – The Path Further Ahead

- Investigate better mixtures of aerogel and concrete.
  - Smaller aerogel granulates.
  - Larger aerogel content (> 60 vol%) in concrete.
- Tailor-make NIM.
  - Pursue the lowest possible NIM thermal conductivity.
  - Incorporation of NIM into concrete.
- Mechanical strengthening remedies.
  - Various carbon nano tubes (CNT) possibilities.
  - Other possibilities.
- Life cycle analysis (LCA).
  - Different concrete og nano material combinations.
  - Comparison with other materials and solutions.

# Phase Change Materials (PCM)

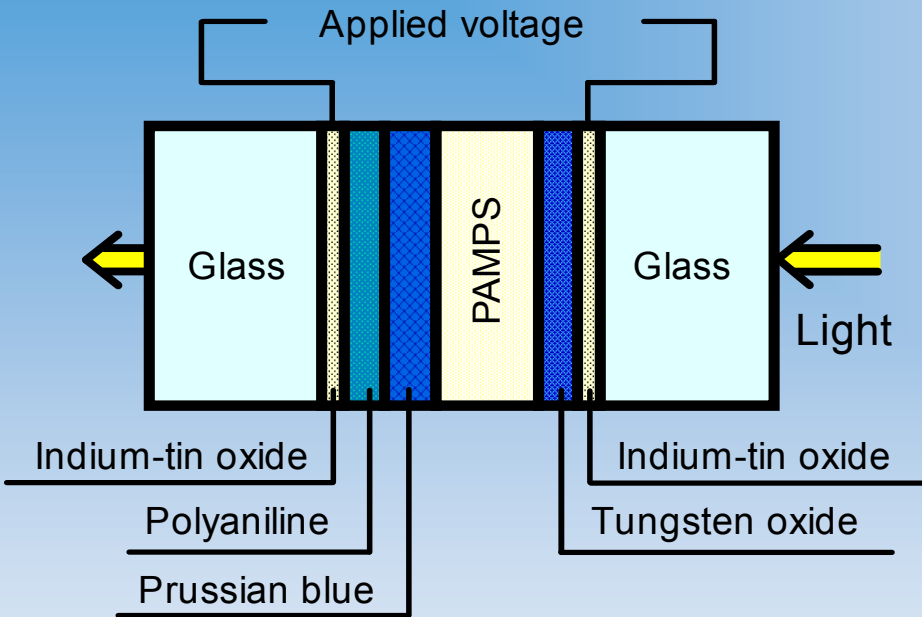

- Solid State  $\leftrightarrow$  Liquid
- Heat Storage and Release

Decreasing the Peak Temperatures

# Electrochromic Windows

## Regulating Solar Radiation Throughput by an External Voltage

- Transmittance Regulation by:
- Absorbance or Reflectance

# Commercial Electrochromic Windows

**Transparent**

**Coloured**

# Development of a New Glass Material

- A new glass material has been made: →
- Reduced mass density (weight) by a factor 1.6
- Reduced thermal conductivity by a factor 5.4
- Increased solar transmittance

## Insulating Glazing with Silica Aerogel Granules

- Miscellaneous investigations:
  - Particle size impact
  - Convection studies
  - Characterization and method development
  - Energy and daylight calculations and evaluations

# Aerogels

**Aerogel for opaque building applications (Aspen Aerogels 2009).**

**Translucent aerogel (NASA 2010).**

**Transparent aerogel (although blurred) (Jensen et al. 2004).**

**UV-VIS-NIR and IR transmittance of translucent/transparent aerogel (redrawn from Ramakrishnan et al. 2007).**

- Aerogels:
- Opaque
- Translucent
- Transparent

© Rasmus Gullberg AIRGLASS AB

**Transparent aerogel (although blurred) (Airglass 2014).**

# Aerogels

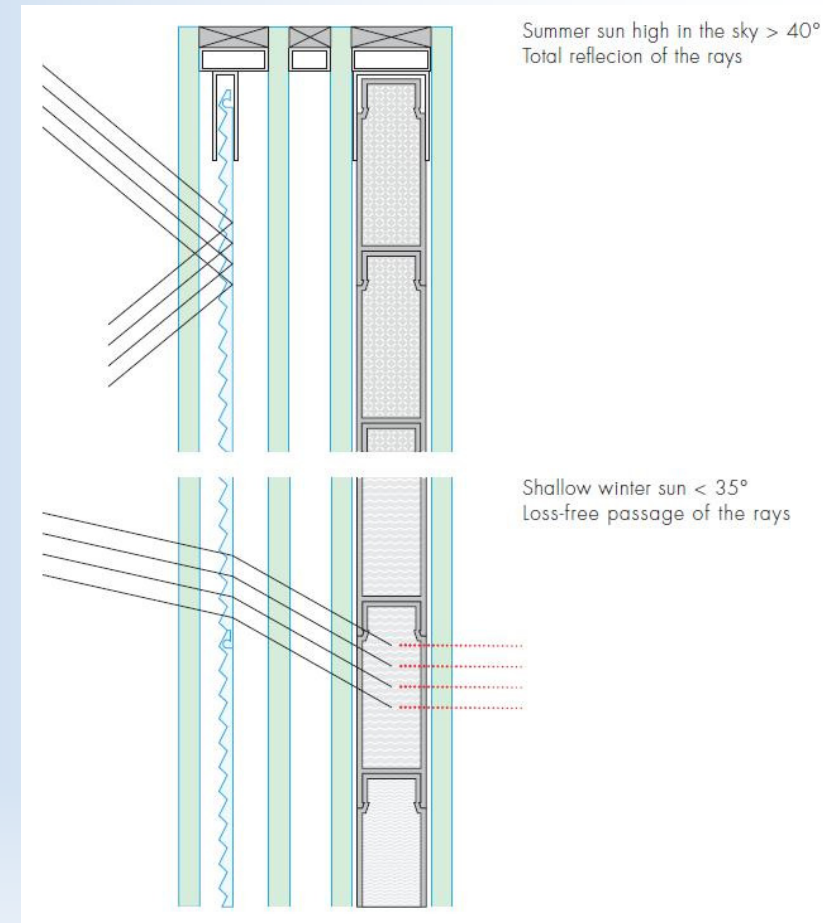

Translucent aerogel in use in Sculpture Building and Gallery of Yale University, New Haven, Connecticut, USA.

KALWALL High-Performance Translucent Building Systems.

- Aerogels:
- Opaque
- Translucent
- Transparent

# Phase Change Materials (PCM) in Windows

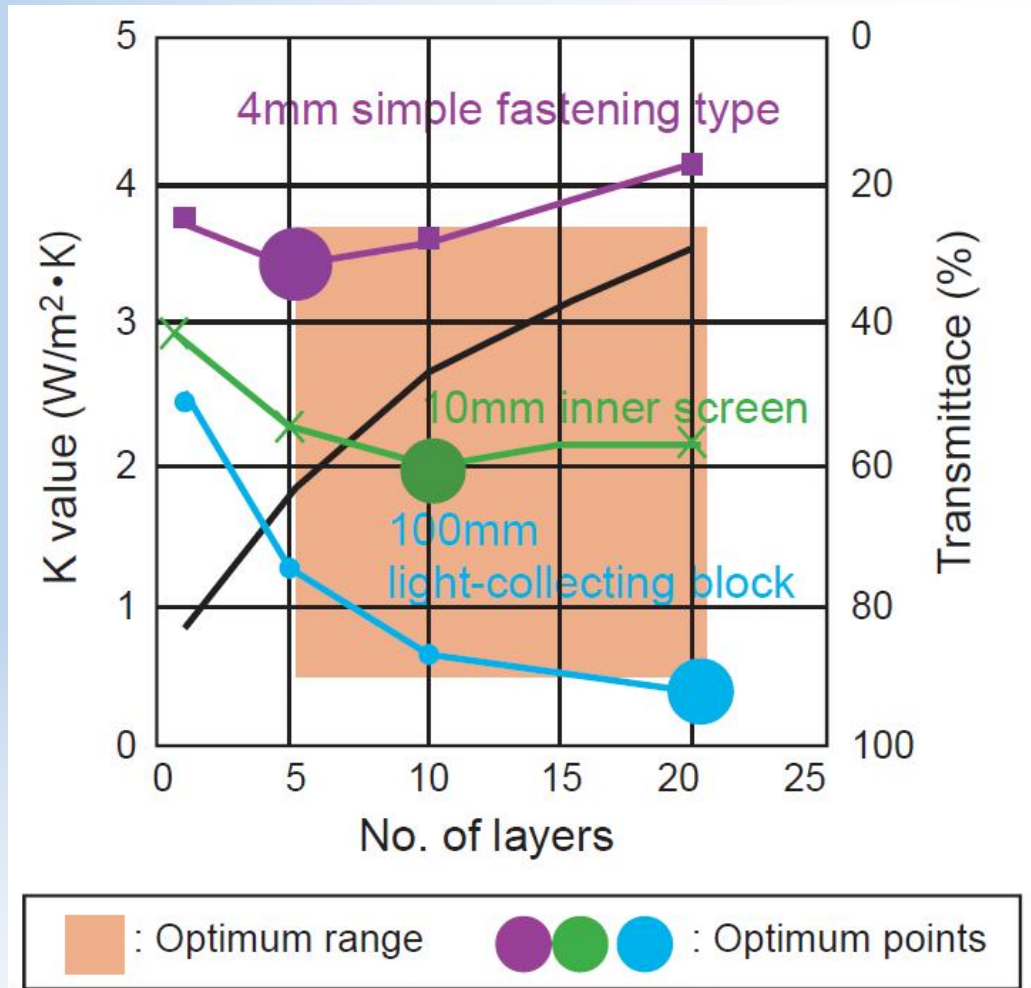

**Building with the GlassX crystal translucent wall element incorporating PCMs.**

**Principal drawing of the GlassX crystal PCM window system.**

# Air Sandwich

**Sekisui air sandwich with principal drawings and U-value and  $T_{vis}$  performance with respect to number of air layers divided by thin plastic films. The U-value is depicted for three given fixed widths (i.e. 4, 10 and 100 mm) (Sekisui 2007, 2010).**

# Glass – Solar Radiation – Self-Cleaning Window Panes

## Window Panes Cleaning Themselves? How?

Solar Radiation (UV) + Water + Special Coating (e.g.  $TiO_2$ )

Vinduet blir skittent 1

[www.pilkington.no](http://www.pilkington.no)

2 Dagslys løser opp smuss

How well does it work?  
Organic vs. Inorganic Dirt?

3 Regnet skyller bort smuss

Other Pathways  
- Superhydrophobic

From Nature  
To  
Artificial

# Building Integrated PhotoVoltaics (BIPV)

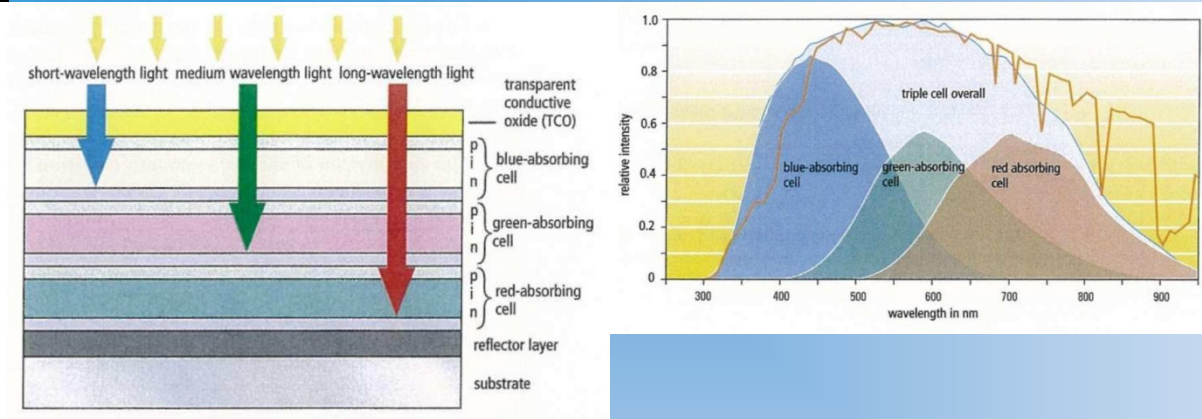

## - Today and Tomorrow

- Replacing the outer building envelope skin, i.e. both a climate screen and a power source generating electricity.
- Fulfil the requirements of both:
  - Building envelope.
  - PV solar cells.
- Durability in general and vs. climate exposure factors.
- Rain, air and wind tightness, various building physical aspects like heat and moisture transport, etc.
- Reducing electricity costs.
- Savings in materials and labour.
- State-of-the-art BIPV products.
- Possible future BIPV research paths.

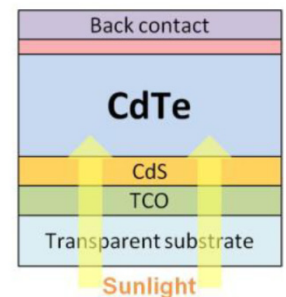

# New Materials and Solutions for BIPV

*"think thoughts not yet thought of" and "the more we know the more we know we don't know"*  
 (Jelle et al. 2010).

Deposition order
